

Analytic Performance Dashboard for tracking COVID-19

Philips TransformAnalytics Performance Dashboards can provide at-a-glance visibility and surveillance of COVID-19 patient data and trends. Data fields are customized to each facility, including patients presenting with symptoms, confirmed diagnosis, patient origin mapping, wait times, testing results, and possible staff risk factors.

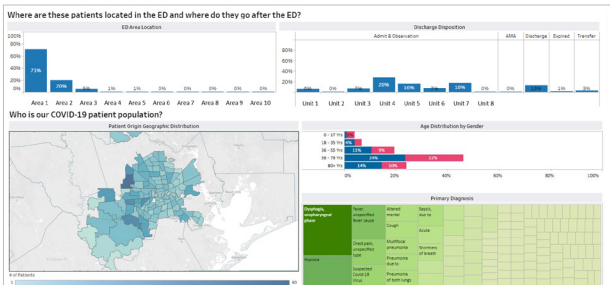

Staff and leadership can quickly see patient trends and easily drill-down to view additional detail for each data field, down to the granularity of patient-level data. Our analytics consultants provide analytical support throughout each project to ensure clinical teams understand and leveraging the new data views to gain insights on patient care trends.

Philips has implemented custom COVID-19 data fields for several clients across the US and Australia, where an existing Philips TransformAnalytics Performance Dashboard was in place.

For new dashboard requests, our team will review the facility requirements and collaborate with the clinical teams to determine which data fields are best to leverage for entry and tracking. From there, a near-real time data feed will be established to receive that agreed data for tracking and analysis. The dashboard provides summarized monitoring reports to specified users that will be distributed via email on a frequent basis.

The analytical assessment, dashboard development and training, and consultative support is provided remotely. The creation of a data transfer process and file extract, as well as HL7 connections, are required. Depending on IT resources, Philips can stagger the implementation steps to ensure as minimal an impact on IT as possible.

Our standard TransformAnalytics Performance Dashboards provide insights on traditional patient data including patient volume, scheduling, patient flow, room utilization, nurse/physician metrics, and more.
